TESTIMONIAL

JCommerce SA has been working with us since March 2016 on the implementation and further development of Qlik Sense.

The first stage of our project began with the understanding of business analysis for the implementation of a new BI tool - the existing data structures, business processes and reporting needs were analyzed.

Subsequently, the new Qlik Sense application was designed and implemented. This responsive application is used for field verification of business partners by a group of approx. 20-30 users, mostly managerial staff. It shows the geographical distribution of shops in accordance with the main sales indicators; and allows users to analyze the selected point of sales, verify product presentation regarding the terms of the contract, and see pictures of the goods in the store. The processes of data importing and transformation, as well as data analysis, were prepared in Qlik Sense, while the web application supports the distribution of objects and their interactivity. The key technologies used in creating the solutions were Qlik Sense, HTML5, and JavaScript. Currently, JCommerce specialists are offering continued support in the design and implementation of new reports and analyses.

After almost one year of cooperation in the Business Intelligence domain, we have we can evaluate JCommerce as a highly professional company with strong technical skills. In the framework of cooperation, all work on the project was done as agreed.

As Head of Business Intelligence at Samsung Electronics Polska, I can recommend JCommerce as a reliable partner, providing Qlik Sense implementation projects with high quality.

Andrzej Czechowski

Head of Business Intelligence
